Master of Astrophysics

Rheinische Friedrich-Wilhelms-Universität Bonn

(valid from WS 2014/2015)

Table of Contents: M.Sc. in Astrophysics (PO von 2014)

physics601 Advanced Laboratory Course	1
physics601 Advanced Laboratory Course	2
astro608 Theoretical Astrophysics	4
astro608 Theoretical Astrophysics.....	5
astro810 Compulsory Astrophysics I.....	6
astro811 Stars and Stellar Evolution or specific: Stellar Structure and Evolution.....	7
astro812 Cosmology.....	8
astro820 Compulsory Astrophysics II.....	9
astro821 Astrophysics of Galaxies	10
astro822 Physics of the Interstellar Medium.....	11
astro830 Seminar: Astrophysics	12
astro840 Elective Advanced Lectures: Observational Astronomy	13
astro841 Research Project	14
astro841 Radio Astronomy: Tools, Applications, Impacts	15
astro842 Submillimeter Astronomy.....	16
astro843 Astronomical Interferometry and Digital Image Processing.....	17
astro845 Observational Cosmology.....	18
astro846 Wave Optics and Astronomical Applications	19
astro847 Optical Observations	20
astro848 Galactic and Intergalactic Magnetic Fields	21
astro849 Multiwavelength Observations of Galaxy Clusters	22
astro8401 Introduction to Hydro- and Magnetohydrodynamics	23
astro8402 X-Ray Astronomy.....	24
astro8403 Hydrodynamics and astrophysical magnetohydrodynamics.....	25
astro8404 Radiointerferometry: Methods and Science.....	26
astro8405 The Cosmic Microwave Background	27
Active Galactic Nuclei (OA)	28
Methods of Experimental Astrophysics (OA)	29
The Fourier-Transform and its Applications (OA)	30
astro850 Elective Advanced Lectures: Modern Astrophysics.....	31
astro831 Research Project	32
astro851 Stellar and Solar Coronae	33
astro852 Gravitational Lensing	34
astro8531 The Physics of Dense Stellar Systems as the Building Blocks of Galaxies.....	35
astro854 Numerical Dynamics.....	37
astro856 Quasars and Microquasars.....	38
astro857 Star Formation	39
astro858 Nucleosynthesis.....	40
astro859 The cosmic history of the intergalactic medium.....	41
astro8501 Binary Stars	42
astro8502 Physics of Supernovae and Gamma-Ray Bursts	43
astro8503 Radio and X-Ray Observations of Dark Matter and Dark Energy	44
astro8504 Lecture on Advanced Topics in Modern Astrophysics	45
astro8505 Introduction to MoND	46
astro8506 Statistical Methods in Cosmology & Astrophysics	47
astro8507 Advanced Topics in Cosmology	48
astro8508 Dynamics of Astrophysical Fluids and Plasmas	49
Astrophysics II (MA).....	50

Star Formation (MA)	51
Galaxy Dynamics (MA)	52
astro940 Scientific Exploration of the Master Thesis Topic	53
astro950 Methods and Project Planning	54
astro960 Master Thesis	55

Module No.: physics601
Credit Points (CP): 7
Category: Required
Semester: 1.

Module: Advanced Laboratory Course

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Advanced Laboratory Course	physics601	7	Laboratory	210 hrs	WT/ST

Requirements for Participation:

Form of Examination:

written report for every laboratory

Content:

Every student has to complete this Laboratory Course. The course consists of advanced experiments introducing into important subfields of contemporary experimental physics and astrophysics. The lab-course is accompanied by a seminar.

Aims/Skills:

The students shall gain insight in the conceptual and complex properties of relevant contemporary experiments. The students gain experience in setting up an experiment, data logging and data analysis. They experience the intricacies of forefront experimental research

Course achievement/Criteria for awarding cp's:

Before carrying out an experiment, the students shall demonstrate to have acquired the necessary preparatory knowledge. Experiments are selected from the catalogue of laboratory set-ups offered. Cumulative lab-units of ≥ 9 are required.

Requirements for the examination (written report for every laboratory): successful completion of the experiment and initial oral questioning plus seminar talk

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Module:**Advanced Laboratory Course****Module No.:** physics601**Course:****Advanced Laboratory Course****Course No.:** physics601

Category	Type	Language	Teaching hours	CP	Semester
Required	Laboratory	English	3+2	7	WT/ST

Requirements for Participation:

Lab course physik661 "Praktikum Kerne und Teilchen" or successful completion of the experiment "Nuclear electronics and lifetime measurement" of physik661.

Preparation:

An appropriate knowledge of the physics background and the experimental environment of the laboratories is required. Recommended lectures are specified in the catalogue of laboratories.

Form of Testing and Examination:

Experiments are selected from the catalogue of laboratory setups offered. Five experiments are required. One of the experiments 1-3 is compulsory for physics students. Two of the experiments 14-17 are compulsory for astrophysics students. Requirements for the module examination (written report for every laboratory): successful completion of the experiment and initial oral questioning

Length of Course:

1 semester

Aims of the Course:

The student shall gain insight in the intricate workings of physics in relevant advanced experiments. The student gains experience in the setting up of a proper experimental environment and experiences the intricacies of forefront experimental research and presenting his/her results.

Contents of the Course:

Advanced experiments are carried out. Experimenting time ~8 to 16 hrs, preparation time and report writing each ~15 hrs. The experiments are chosen among those being offered and after consultation with the head of the course.

In the accompanying seminar the students report about one experiment. This experiment will be selected after consultation with the head of the course.

Recommended Literature:

Hand outs and literature will be distributed with the registration for an experiment

Catalogue of laboratories: (subject to change, for an up-to-date catalogue see
<https://www.physik-astro.uni-bonn.de/praktika/en/modules/physics601>)

1. Analysis of decays of heavy vector boson Z0
2. ATLAS
3. Investigation of particle-antiparticle oscillations at BELLE-II
4. Radiofrequency cavities for particle acceleration
5. Lab course accelerator Bonn (LAB)
6. Properties of elementary particles
7. STYX
8. Positron lifetime in metals and insulators
9. Nuclear γ - γ angular correlations
10. Optical frequency doubling
11. Laser spectroscopy
12. Magneto-optic trap

13. Laser Gyroscope
14. Optical astronomy (Recommended: astro800 Introduction to Astrophysics or an equivalent basic knowledge in astrophysics)
15. Setting up a Radio-astronomical receiver / Setting up a Radio Interferometer (Recommended: lecture astro123 "Einführung in die Radioastronomie" or lecture astro841 Radio Astronomy: tools, application, impacts)
16. Photometry of star clusters
17. Radio astronomical observing course (Recommended: lecture astro123 "Einführung in die Radioastronomie" or lecture astro841 Radio Astronomy: tools, application, impacts)

Module No.: astro608
Credit Points (CP): 7
Category: Required
Semester: 1.

Module: Theoretical Astrophysics

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Theoretical Astrophysics	astro608	7	Lect. + ex.	210 hrs	WT

Requirements for Participation:

Form of Examination:

written examination

Content:

Introduction into Theoretical Astrophysics

Aims/Skills:

To provide the students with sound theoretical bases on a number of topics that have wide applications in astrophysics. They include general relativity, kinetic theory, plasma and fluid dynamics, stochastic and radiative processes, and radiative transfer.

Course achievement/Criteria for awarding cp's:

successful work with exercises

Length of Module:

1 semester

Maximum Number of Participants:

ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Module:**Theoretical Astrophysics****Module No.:** astro608**Course:****Theoretical Astrophysics****Course No.:** astro608

Category	Type	Language	Teaching hours	CP	Semester
Required	Lecture with exercises	English	3+2	7	WT

Requirements for Participation:**Preparation:**

Theoretical courses at the Bachelor degree level

Form of Testing and Examination:

Requirements for the examination (written): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

The goal of this course is to provide the students with sound theoretical bases on a number of topics that have wide applications in astrophysics. They include general relativity, kinetic theory, plasma and fluid dynamics, stochastic and radiative processes, and radiative transfer.

Contents of the Course:

Introduction to General Relativity, Schwarzschild metric and gravitational waves.
Kinetic theory, Klimontovich equation, BBGKY hierarchy, Boltzmann and Vlasov equations, fluid limit, transport coefficients.
Basics of hydrodynamics, spherical flows, shock waves, Bondi accretion.
Random fields and stochastic processes, correlation and structure functions, power spectrum and multispectra, Langevin and Fokker-Planck equations.
Continuum radiation processes, synchrotron radiation, free-free radiation, Compton scattering.
Radiation from bound-free and bound-bound transitions.
Radiative transfer.
Concepts of plasma physics, Langmuir waves, Alfvén waves, Faraday rotation, dispersion relations.

Recommended Literature:

Lecture notes

S. Carroll, Spacetime and Geometry (Addison Wesley 2004)
F.F. Chen, Introduction to Plasma Physics and Controlled Fusion (Springer 1984)
K. Huang, Statistical Physics (John Wiley & Sons 1987)
C.W. Misner, K.S. Thorne, J.A. Wheeler, Gravitation (Freeman 1973)

F.H. Shu, The Physics of Astrophysics, Vol I & II (University Science Books 2010)

Module No.: astro810
Credit Points (CP): 12
Category: Required
Semester: 1.

Module: Compulsory Astrophysics I

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Stars and Stellar Evolution or specific: Stellar Structure and Evolution	astro811	6	Lect. + ex.	180 hrs	WT
2.	Cosmology	astro812	6	Lect. + ex.	180 hrs	WT

Requirements for Participation:

Form of Examination:

written examination

Content:

The module represents the fundamentals of the phases of stars and stellar evolution and the knowledge about our cosmological model

Aims/Skills:

The student shall acquire deeper understanding of the workings of stars and their evolution, in particular of important transitory phases of evolution, and shall be able to understand the origin of stars related with the location of their parameters in the HRD.

The student shall acquire deep understanding of the foundation of our world models and of their consequences, with special emphasis on the formation of structures in the universe and its physical and observational consequences

Course achievement/Criteria for awarding cp's:

successful work with the exercises

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Module:**Compulsory Astrophysics I****Module No.:** astro810**Course:****Stars and Stellar Evolution
or specific: Stellar Structure and
Evolution****Course No.:** astro811

Category	Type	Language	Teaching hours	CP	Semester
Required	Lecture with exercises	English	3+1	6	WT

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

Students will acquire sufficient knowledge to understand stars and their evolution. Study of radiation transport, energy production, nucleosynthesis and the various end phases of stellar evolution shall lead to appreciation for the effects these processes have on the structure and evolution of galaxies and of the universe

Contents of the Course:

Historical introduction, measuring quantities, the HRD. Continuum and line radiation (emission and absorption) and effects on the stellar spectral energy distribution. Basic equations of stellar structure. Nuclear fusion. Making stellar models. Star formation and protostars. Brown Dwarfs. Evolution from the main-sequence state to the red giant phase. Evolution of lower mass stars: the RG, AGB, HB, OH/IR, pAGB, WD phases. Stellar pulsation. Evolution of higher mass stars: supergiants, mass loss, Wolf-Rayet stars, P-Cyg stars. Degenerate stars: White Dwarfs, Neutron Stars, Black Holes. Supernovae and their mechanisms. Binary stars and their diverse evolution (massive X-ray binaries, low-mass X-ray binaries, Cataclysmic variables, etc.). Luminosity and mass functions, isochrones. Stars and their influence on evolution in the universe

Recommended Literature:

Lecture notes on "Stars and Stellar Evolution" (de Boer & Seggewiss)

Module:**Compulsory Astrophysics I****Module No.:** astro810**Course:**  **Cosmology****Course No.:** astro812

Category	Type	Language	Teaching hours	CP	Semester
Required	Lecture with exercises	English	3+1	6	WT

Requirements for Participation:**Preparation:**

Introductory astronomy

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

The student shall acquire deep understanding of the foundation of our world models and of their consequences, with special emphasis on the formation of structures in the universe and its physical and observational consequences. The lecture shall enable the student to read and understand original literature in astrophysical cosmology, but also to see the direct connection between the fundamental problems in cosmology and particle physics, such as the nature of dark matter and dark energy

Contents of the Course:

Kinematics and dynamics of cosmic expansion, introduction to General relativity, Friedmann equations and classification of world models, flatness and horizon problem; thermal history of the big bang, decoupling, WIMPS, nucleosynthesis, recombination and the CMB; gravitational light deflection, principles and applications of strong and weak gravitational lensing; structure formation in the Universe, perturbation theory, structure growth and transfer function, power spectrum of cosmic fluctuations, spherical collapse model, Press-Schechter theory and generalizations, cosmological simulations, cosmic velocity fields; principles of inflation; lensing by the large-scale structure, cosmic shear; anisotropies of the CMB, determination of cosmological parameters

Recommended Literature:

J. A. Peacock; Cosmological Physics (Cambridge University Press 1998)

P. J. E. Peebles; Principles of Physical Cosmology (Princeton University Press 1993)

Handout of the Transparencies

Module No.: astro820
Credit Points (CP): 12
Category: Required
Semester: 2.

Module: Compulsory Astrophysics II

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Astrophysics of Galaxies	astro821	6	Lect. + ex.	180 hrs	ST
2.	Physics of the Interstellar Medium	astro822	6	Lect. + ex.	180 hrs	ST

Requirements for Participation:

Form of Examination:

written examination

Content:

This module presents both, theoretical aspects, as well as the detailed properties of the major building blocks of cosmic structure, viz. galaxies. The fundamentals of the physics of the interstellar medium are conveyed, along with the tools used to study its properties

Aims/Skills:

The student shall acquire knowledge about the properties of galaxies, including their formation and their evolution, based on knowledge of the constituent matter (stars, gas, dark matter). The fundamentals of stellar dynamics are also conveyed. Physical processes relevant for the study of the interstellar medium have to be understood including the basic methods of measurements and their interpretation of the fundamental phases of the ISM

Course achievement/Criteria for awarding cp's:

successful work with the exercises

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Module:**Compulsory Astrophysics II****Module No.:** astro820**Course:****Astrophysics of Galaxies****Course No.:** astro821

Category	Type	Language	Teaching hours	CP	Semester
Required	Lecture with exercises	English	3+1	6	ST

Requirements for Participation:**Preparation:**

Introductory astronomy as well as a good understanding of stars and their evolution as well as of the interstellar medium

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with exercises

Length of Course:

1 semester

Aims of the Course:

The student shall acquire deep knowledge of the structure of the Milky Way and of other galaxies including their evolution.

This must enable them to understand and evaluate new publications in the field. It should provide the student a quick entry into the research phase of the study programme

Contents of the Course:

Review of stars and stellar evolution, review of the interstellar medium. Solar neighbourhood: observables, differential galactic rotation, Hyades, Goulds Belt, Local Bubble. The Galaxy: size, dynamics of objects, rotation curve, disk and z-distribution. Stellar dynamics: Boltzmann, Jeans drift, Schwarzschild ellipsoid, scale length and height, density wave, mass distribution, age of populations, dark matter concept, evolution. Satellites: the Magellanic Clouds, their structure and evolution, Magellanic Stream, Dwarf spheroidals, Local Group galaxies. Star clusters: stellar dynamics, binary and multiple stars, energy exchange, star-cluster birth and death, origin of galactic field population. Active galactic nuclei: observables, jets, accretion, black holes. Structure and shape of spirals and ellipticals, surface brightness, globular cluster systems. Galaxy clusters: distances, statistics, luminosity function, X-ray halos, virial theorem. Galaxy evolution: chemical enrichment, galactic winds, infall, observables. Galaxy collisions: relaxation, mergers, birth of dwarf galaxies

Recommended Literature:

J. Binney; B. Merrifield; Galactic Astronomy (Princeton University Press 1998)

J. Binney, S. Tremaine; Galactic Dynamics (Princeton University Press 1988)

L. S. Sparke; J. S. Gallagher; Galaxies in the Universe (Cambridge University Press, 2000)

Write-up of the class

Module:**Compulsory Astrophysics II****Module No.:** astro820**Course:****Physics of the Interstellar Medium****Course No.:** astro822

Category	Type	Language	Teaching hours	CP	Semester
Required	Lecture with exercises	English	3+1	6	ST

Requirements for Participation:**Preparation:**

Introductory astronomy

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

The student shall acquire a good understanding of the physics and of the phases of the ISM. The importance for star formation and the effects on the structure and evolution of galaxies is discussed.

Contents of the Course:

Constituents of the interstellar medium, physical processes, radiative transfer, recombination, HI 21cm line, absorption lines, Stroemgren spheres, HII regions, interstellar dust, molecular gas and clouds, shocks, photodissociation regions, energy balances, the multi-phase ISM, gravitational stability and star formation.

Recommended Literature:

B. Draine; The Physics of the Interstellar and Intergalactic Medium (Princeton Univ. Press 2010)
J. Lequeux; The Interstellar Medium (Springer 2005)

Module No.: astro830
Credit Points (CP): 4
Category: Elective
Semester: 2.

Module: Seminar: Astrophysics

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Seminar on Modern Topics in Astrophysics		4		120 hrs	WT/ST

Requirements for Participation:

Form of Examination:

Presentation

Content:

Modern developments in astrophysics are discussed using recent literature

Aims/Skills:

These seminars will introduce the student for the first time into professional research in astrophysics. Active participation will furnish the student with the skill to read and present modern research topics

Course achievement/Criteria for awarding cp's:

regular participation and active contribution

Length of Module:

1 semester

Maximum Number of Participants:

ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Useable for:

Masterstudiengang Astrophysik, Pflicht, Semester: 1-2

former astro890

Module No.: astro840
Credit Points (CP): 84
Category: Elective
Semester: 1.-2.

Module: Elective Advanced Lectures: Observational Astronomy

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Selected 84* courses from catalogue	astro84*	3-6	see catalogue	90-120 hrs	WT/ST
2.	Astrophysics Courses from Cologne marked "OA"	see catalogue	4	see catalogue	120 hrs	WT/ST
3.	Also possible classes from M.Sc. in Physics					

Requirements for Participation:

Form of Examination:

written examination

Content:

This module covers all observational tools used in modern astronomy, over a wide range of the electromagnetic spectrum

Aims/Skills:

Observational astronomy shall be conveyed to the students by teaching the fundamentals of observational astronomical tools, along with relevant applications. These tools cover essentially the entire electro-magnetic spectrum, from radio wavelengths through X-ray energies. They naturally also encompass a wide range of astrophysical phenomena, including condensed matter (stars, neutron stars), the interstellar and intergalactic medium, galaxies and active galactic nuclei, and clusters of galaxies. Emphasis is also on observational cosmology

Course achievement/Criteria for awarding cp's:

see with the course

Length of Module:

1 semester

Maximum Number of Participants:

ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

The students must obtain 18 CP in all out of the modules astro840 and astro850.

Modules:

astro840 **Elective Advanced Lectures: Observational Astronomy**
astro850 **Elective Advanced Lectures: Modern Astrophysics**

Course:**Research Project**

Course No.: astro831

Category	Type	Language	Teaching hours	CP	Semester
Elective	Research Project	English		4	WT/ST

Requirements for Participation:

Students are asked to contact one of the BCGS lecturers prior to the start of their project. Lecturers provide help if needed to find a suitable research group and topic. Not all groups may have projects available at all times, thus participation may be limited.

Preparation:

A specialization lecture from the research field in question or equivalent preparation.

Form of Testing and Examination:

A written report or, alternatively, a presentation in a meeting of the research group.

Length of Course:

4-6 weeks

Aims of the Course:

Students conduct their own small research project as a part-time member of one of the research groups in Bonn. The students learn methods of scientific research and apply them to their project.

Contents of the Course:

One of the following possible items:

- setting up a small experiment,
- analyzing data from an existing experiment,
- simulating experimental situations,
- numerical or analytical calculations in a theory group.

Recommended Literature:

provided by the supervisor within the research group.

registration by written application to the examination office (see homepage)

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Radio Astronomy: Tools,
Applications, Impacts****Course No.:** astro841

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	3+1	6	WT

Requirements for Participation:**Preparation:**

Good knowledge of electrodynamics, atomic physics, and astronomy

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

An introduction to modern radio astronomy, its history, methods, and research potentials is given. The goals are to equip the student with the background and know-how to analyze and interpret data from modern single-dish and interferometer radio telescopes, and to enable them to motivate and write radioastronomical observing proposals. Aperture synthesis techniques are explained at some depth. The lecture is furnished with numerous examples demonstrating the versatility and power of radioastronomical tools

Contents of the Course:

Radiation: processes, propagation; Signal detection; Radio telescopes: properties, types; Receivers: heterodyne, bolometers; Backends: continuum, spectroscopy, pulsars; Interferometers: Fourier optics, aperture synthesis; imaging; Future: APEX, ALMA, LOFAR.

Recommended Literature:

- B. F. Burke; F. Graham-Smith, An Introduction to Radio Astronomy (Cambridge University Press 2002)
- T. L. Wilson; C. Rohlfs; Tools of Radio Astronomy (Springer, Heidelberg 4. rev. und erw. Ed. 2006)
- J. D. Kraus; Radio Astronomy (Cygnum-Quasar Books, Durham 2. Aufl. 1986)
- R.A. Perley; F. R. Schwab, A.H. Bridle; Synthesis Imaging in Radio Astronomy, 3rd NRAO Summer School 1988 (Astronomical Society of the Pacific Conference Series, 1989)
- A. R. Thompson, J. M. Moran, G.W. Swenson, Interferometry and Synthesis in Radio Astronomy (Wiley & Sons, Weinheim 2. Aufl. 2001)
- Lecture Notes (U. Klein)

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Submillimeter Astronomy****Course No.:** astro842

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	WT

Requirements for Participation:**Preparation:**

Basic astronomy knowledge

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

Students with B.Sc. in Physics will be introduced to astronomy in the submillimeter wavelength range, one of the last spectral regions to be explored with new high-altitude ground-based or airborne telescopes, and from space

Contents of the Course:

The basic concepts of emission/excitation mechanisms from interstellar dust and molecules are discussed as well as the properties of the observed objects: the dense interstellar medium, star forming regions, circumstellar environments. Star formation near and far is a central focus of submillimeter astronomy and will thus be introduced in depth. Telescopes, instrumentation, and observational techniques will be described in the course

Recommended Literature:

Contemporary review articles

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Astronomical Interferometry and
Digital Image Processing****Course No.:** astro843

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture	English	2	3	WT

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Written or oral examination

Length of Course:

1 semester

Aims of the Course:

Students learn the basics required to carry out research projects in the field of wave optics and astronomical infrared interferometry

Contents of the Course:

Statistical optics; Wave optics; image detectors; resolution enhancement by digital deconvolution; interferometric imaging methods in optical astronomy; Theory of photon noise; iterative image reconstruction methods; astronomical applications

Recommended Literature:J. W. Goodman; Introduction to Fourier Optics (Roberts & Company Publishers 3. Aufl. 2004)
Lecture Notes

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

Students with B.Sc. in Physics will be introduced to past and current experiments in cosmology, with some bias toward radio- and submillimeter astronomy

Contents of the Course:

Brief history of cosmology and its initial discoveries: cosmic expansion, cosmic microwave background. Overview of modern cosmological experiments, their major aims and technology. Aims: constraints on Big Bang and dark energy, CMB power spectrum and polarization, Sunyaev-Zeldovich effect, Supernova Ia distance measures, structure /cluster /galaxy formation, epoch of reionization, high-redshift galaxies and quasars. Experiments: APEX, LOFAR, Planck, Herschel, ALMA, SKA. Techniques: bolometer, HEMT

Recommended Literature:

B. F. Burke; F. Graham-Smith, An Introduction to Radio Astronomy (Cambridge University Press 2002)

J. A. Peacock; Cosmological Physics (Cambridge University Press 1998)

Contemporary Review Articles

Requirements for Participation:**Preparation:**

Good knowledge of electrodynamics and astronomy

Form of Testing and Examination:

Requirements for examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

The students shall become familiar with relativistic plasmas in astrophysics. They shall comprehend the origin and significance of magnetic fields in diffuse astrophysical media. The potential role of magnetic fields in the evolution of the universe will be discussed. The detection and quantitative measurements of magnetic fields in the ISM and IGM shall be conveyed, along with a description of the current and future observational facilities.

Contents of the Course:

Introduction: magnetism, physical quantities, history, observational evidence; radiation processes: radiation transport, free-free radiation, synchrotron radiation, inverse-Compton radiation, propagation effects; diagnostics: optical polarisation, synchrotron radiation, Faraday rotation, Zeeman effect; radio continuum observations: total and polarised intensity, rotation measure, RM synthesis, telescopes; Milky Way: diffuse ISM, molecular clouds and star-forming regions, supernova remnants, diffusive shock acceleration, cosmic rays, origin and maintenance of magnetic fields, galactic dynamo; external galaxies: spiral galaxies, dwarf irregular galaxies, elliptical galaxies, origin of magnetic fields; active galactic nuclei: radio galaxies, quasars, Seyfert galaxies, origin of magnetic fields; intergalactic magnetic fields: clusters of galaxies, radio halos, radio relics, mini-halos, magnetisation of the IGM, cosmological shocks; cosmological magnetic fields

Lecture Notes (U. Klein)

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Multiwavelength Observations of
Galaxy Clusters****Course No.:** astro849

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:**

Introductory Astronomy lectures

Form of Testing and Examination:

Written or oral examination, successful exercise work

Length of Course:

1 semester

Aims of the Course:

To introduce the students into the largest clearly defined structures in the Universe, clusters of galaxies. In modern astronomy, it has been realized that a full understanding of objects cannot be achieved by looking at just one waveband. Different phenomena become apparent only in certain wavebands, e.g., the most massive visible component of galaxy clusters - the intracluster gas - cannot be detected with optical telescopes. Moreover, some phenomena, e.g., radio outbursts from supermassive black holes, influence others like the X-ray emission from the intracluster gas. In this course, the students will acquire a synoptic, multiwavelength view of galaxy groups and galaxy clusters.

Contents of the Course:

The lecture covers galaxy cluster observations from all wavebands, radio through gamma-ray, and provides a comprehensive overview of the physical mechanisms at work. Specifically, the following topics will be covered: galaxies and their evolution, physics and chemistry of the hot intracluster gas, relativistic gas, and active supermassive black holes; cluster weighing methods, Sunyaev-Zeldovich effect, gravitational lensing, radio halos and relics, and the most energetic events in the Universe since the big bang: cluster mergers.

Recommended Literature:

Lecture script and references therein

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Introduction to Hydro- and
Magnetohydrodynamics****Course No.:** astro8401

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture	English	2	3	ST

Requirements for Participation:**Preparation:**

Revision of vectors and vector calculus, electromagnetism, basic thermodynamics

Form of Testing and Examination:

Written or oral examination

Length of Course:

1 semester

Aims of the Course:

The students will become familiar with the basic laws of hydrodynamics and magnetohydrodynamics and will understand their universal applicability and importance in many varied contexts. As well as learning about the basic phenomena such as waves and compressible flow, several particular contexts (mainly in astrophysics and atmospheric physics) will be examined in detail using analytical tools which the students will then learn to apply in other, new situations and contexts. By doing this the students will develop abilities to tackle and interpret any hydrodynamical phenomenon they encounter.

Contents of the Course:

The fluid approximation, Euler equations, ideal fluids, viscous fluids, diffusion of heat, sound waves, hydrostatics, flow around an object, the Bernoulli equation, the Reynolds number and other dimensionless parameters used to describe a flow, compressible and incompressible flow, supersonic and subsonic flow, shock waves (with example: supernovae), surface gravity waves, internal gravity waves, waves in a rotating body of fluid (example: earth's atmosphere), stability analysis (examples: convection, salt fingers in ocean), the magnetohydrodynamics equations, Alfvén waves, flux conservation, flux freezing, magnetic pressure and tension, force-free fields, reconnection (with example: solar corona), angular momentum transport and the magneto-rotational instability (example: astrophysical discs).

Requirements for Participation:**Preparation:**

Introductory astronomy lectures

Form of Testing and Examination:

Written or oral examination, successful exercise work

Length of Course:

1 semester

Aims of the Course:

The student shall be familiarized with X-ray observations as a powerful tool to study almost all astrophysical objects in ways not possible in other wavebands.

Contents of the Course:

History, space-based instruments, radiation processes, solar system objects, isolated compact objects, binaries with compact objects, supernova remnants, interstellar medium, Galactic center, normal galaxies, galaxy clusters, superclusters, intergalactic medium, active galactic nuclei.

Recommended Literature:

Lecture notes will be provided

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****Hydrodynamics and
astrophysical
magnetohydrodynamics****Course No.:** astro8403

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:**

Revision of elementary thermodynamics, vector calculus and electromagnetism. Please note that although this course is designed mainly with astrophysics in mind, no knowledge of astrophysics is assumed. Students of other branches of physics are welcome.

Form of Testing and Examination:

Exercises throughout the semester, and an oral examination at the end of the course.

Length of Course:

1 semester

Aims of the Course:

Almost the entire universe is fluid and so an understanding of many phenomena is impossible without a proper grasp of fluid dynamics. This course introduces the field, drawing on examples from astrophysics as well as atmospheric physics to illustrate the principles. The aim is for the students to develop an intuitive understanding of underlying principles. Roughly the last quarter of the course is an introduction to magnetohydrodynamics; here the emphasis is on astrophysical applications (rather than laboratory/plasma physics).

Contents of the Course:

The fluid approximation, Euler equations, ideal fluids, viscous fluids, diffusion of heat, sound waves, hydrostatics, flow around a solid body, the Bernoulli equation, the Reynolds number and other dimensionless parameters used to describe a flow, compressible and incompressible flow, supersonic and subsonic flow, shocks (with example: supernovae), surface & internal gravity waves, vortices and vorticity, waves in a rotating body of fluid (example: earth's atmosphere), stability analysis (examples: convection, shear instability), the magnetohydrodynamics equations, Alfvén waves, flux conservation, flux freezing, magnetic pressure and tension, force-free fields, reconnection (with example: solar corona), angular momentum transport and the magneto-rotational instability (example: astrophysical discs).

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****The Cosmic Microwave
Background****Course No.:** astro8405

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	WT

Requirements for Participation:

Some basic knowledge of electrodynamics and thermal physics, and some experience with Python programming. No prior course-work on cosmology is necessary.

Preparation:**Form of Testing and Examination:**

Weekly exercise classes, after successful evaluation of which a final oral exam at the end of the semester

Length of Course:

1 semester

Aims of the Course:

This course intends to give the students a modern and up-to-date introduction to the science and experimental techniques relating to the Cosmic Microwave Background (CMB). No prior knowledge of cosmology is assumed; rather, the course introduces the necessary concepts in the class, and partly depends on the mandatory cosmology course that is taught in parallel. The aim is to make the students interested in the vast field of CMB research, which continues to be one of the richest source of information about our Universe.

Contents of the Course:

Roughly 14 lectures, covering the four main topics of (i) CMB thermal spectrum, (ii) CMB temperature anisotropies and their cosmological significance, (iii) CMB polarization and the search for primordial gravitational waves, and (iv) CMB foregrounds and component separation techniques. There will be weekly exercise classes, some of which involve simple programming and plotting.

Recommended Literature:

Appropriate references are provided during the lectures.

Module:**Elective Advanced Lectures:

Requirements for Participation:**Preparation:**

Astrophysics I (Astrophysics II recommended)

Form of Testing and Examination:

Oral examination

Length of Course:

1 semester

Aims of the Course:

Understanding of fundamental concepts and physical radiation mechanisms for active galactic nuclei
Like Seyfert-galaxies, QSOs, quasars, and violently variable objects.

Contents of the Course:

The lecture introduces to basic aspects of active galactic nuclei:

Types of sources HII-galaxies, LINERs, Seyfert I, Seyfert II, QSO I, QSO II, BLLac /OVV-sources

Structure of an active nucleus: Broad line region (BLR), Narrow line region (NLR) and extended narrow line region (ionization cone).

Forbidden and permitted line transitions as density and temperature probes

Continuum emission processes: free-free and synchrotron radiation

Radio galaxies, jets and lobes as well as super luminal motion in jets.

Requirements for Participation:**Preparation:**

Elementary Physics (Bachelor level); Astrophysics I (and II)

Form of Testing and Examination:

Exercise and written test; or oral examination

Length of Course:

1 semester

Aims of the Course:

Gain insight into which type of instrumentation, based on which principles, is employed for particular astronomical and astrophysical applications; and learn about their practical and fundamental limitations in resolution and sensitivity

Contents of the Course:

- detection of radiation: direct and coherent detection
- Signal/Noise ratio: fundamental and practical limits
- principles of optical instruments: imaging
- principles of optical instruments: spectroscopy
- radio receivers: Local Oscillator, Mixer and Backend-Spectrometers
- calibration: theory and measurement startegies

Recommended Literature:

Rieke: Detection of Light

Kraus: Radioastronomy

Bracewell: The Fourier Transform and its Applications

Module:**Elective Advanced Lectures:
Observational Astronomy****Module No.:** astro840**Course:****The Fourier-Transform and its
Applications (OA)****Course No.:**

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:**

Elementary Physics (Bachelor level); Elementary QM

Form of Testing and Examination:

Exercise and written test; or oral examination

Length of Course:

1 semester

Aims of the Course:

Strengthen insight into how the mathematical principles of Fourier Theory as a common principle affect many areas of physics (optics: diffraction/interference; QM: Heisenberg principle; statistics of noise and drifts; data acquisition: sampling) and other applications (data compression, signal processing).

Contents of the Course:

- introduction to the principles of Fourier Transform mathematics
- Delta-function and more general distributions
- diffraction optics and interferometry
- uncertainty principle in QM as application of FT
- theory of noise, drifts and their statistics
- intro to wavelet analysis and data compression

Recommended Literature:

Bracewell: The Fourier Transform and its Applications

Module No.: astro850
Credit Points (CP):
Category: Elective
Semester: 1.-2.

Module: Elective Advanced Lectures: Modern Astrophysics

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Selected 85* courses from catalogue	astro85*	3-6	see catalogue	90-180 hrs	WT/ST
2.	Astrophysics Courses from Cologne marked "MA"	see catalogue	3-8	see catalogue	90-240 hrs	WT/ST
3.	Also possible classes from M.Sc. in Physics					

Requirements for Participation:

Form of Examination:

written examination

Content:

This module contains a number of lectures on various astrophysical phenomena, from stars to the largescale structure of the universe

Aims/Skills:

The student shall acquire deeper knowledge of a variety of astrophysical phenomena, from stars through large-scale structure to cosmological aspects. The physical mechanisms and mathematical tools required to understand these phenomena shall be conveyed, complementing what is being treated in the compulsory astrophysics courses

Course achievement/Criteria for awarding cp's:

see with the course

Length of Module:

1 semester

Maximum Number of Participants:

ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

The students must obtain 18 CP in all out of the modules astro840 and astro850.

Modules:

astro840 **Elective Advanced Lectures: Observational Astronomy**
astro850 **Elective Advanced Lectures: Modern Astrophysics**

Course: universitätbonn **Research Project**

Course No.: astro831

Category	Type	Language	Teaching hours	CP	Semester
Elective	Research Project	English		4	WT/ST

Requirements for Participation:

Students are asked to contact one of the BCGS lecturers prior to the start of their project. Lecturers provide help if needed to find a suitable research group and topic. Not all groups may have projects available at all times, thus participation may be limited.

Preparation:

A specialization lecture from the research field in question or equivalent preparation.

Form of Testing and Examination:

A written report or, alternatively, a presentation in a meeting of the research group.

Length of Course:

4-6 weeks

Aims of the Course:

Students conduct their own small research project as a part-time member of one of the research groups in Bonn. The students learn methods of scientific research and apply them to their project.

Contents of the Course:

One of the following possible items:

- setting up a small experiment,
- analyzing data from an existing experiment,
- simulating experimental situations,
- numerical or analytical calculations in a theory group.

Recommended Literature:

provided by the supervisor within the research group.

registration by written application to the examination office (see homepage)

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Stellar and Solar Coronae****Course No.:** astro851

Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

The student shall gain thorough knowledge of activity phenomena exhibited by the sun and other stars

Contents of the Course:

Sunspots and solar corona; Solar cycle; The Dynamo theory; Emission mechanism; Coronal loops; Magnetic reconnection; Flares; Magnetic stellar activity; Mapping star-spots: Doppler imaging; Radio coronae

Recommended Literature:

Literature references will be provided during the course

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Gravitational Lensing****Course No.:** astro852

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

After learning the basics of gravitational lensing followed by the main applications of strong and weak lensing, the students will acquire knowledge about the theoretical and observational tools and methods, as well as about the current state of the art in lensing research. Strong emphasis lies on weak lensing as a primary tool to study the properties of the dark-matter distribution and the equation of state of dark energy

Contents of the Course:

The detection of the deflection of light in a gravitational field was not only one of the crucial tests of Einstein's Theory of General Relativity, but has become in the past two decades a highly valuable tool for astronomers and cosmologists. It is ideally suited for studying the mass distribution of distant objects, search for compact objects as a potential constituent of the Galactic dark matter, provide powerful (and cheap) 'natural telescopes' to take a deeper look into the distant Universe, to measure the mass distribution in clusters and on larger spatial scales, and to study the relation between luminous and dark matter in the Universe. Principles and methods are described in detail and the applications will be presented

Recommended Literature:

Systems as the Building Blocks
of Galaxies****Course No.:** astro8531

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	3+2	6	WT

Requirements for Participation:**Preparation:**

Participation in the lecture course and in the exercise classes and reading

Form of Testing and Examination:

A final two hour written exam on the contents of the course

Length of Course:

1 semester

Aims of the Course:

The students are taught the fundamentals of collisional stellar dynamics and of the emergence of stellar populations from galactic building blocks

Contents of the Course:

Fundamentals of stellar dynamics: distribution functions, generating functions, collisionless Boltzmann equation, Jeans equations, Fokker-Planck equation, dynamical states, collisional dynamics and relaxation, formal differentiation between star clusters and galaxies, mass segregation, evaporation, ejection, star-cluster evolution, the form, variation and origin of the stellar initial mass function, stellar populations, their evolution and their properties, binary stars as energy sinks and sources, the distribution functions of binary stars and the evolution of these distribution functions, star-cluster birth, violent relaxation, birth of dwarf galaxies.

The lecture course covers a broad range of topics related to the emergence of stellar populations from their molecular cloud cores. It provides a Bonn-unique synthesis on the one hand side between observationally and theoretically derived distribution functions, which describe stellar populations, and on the other hand side the temporal evolution of these distribution functions, such that a comprehensive mathematical formulation of stellar populations in galaxies becomes possible with this knowledge.

Introduction to Astronomy, Stars and Stellar Evolution

Form of Testing and Examination:

Written or oral examination

Length of Course:

1 semester

Aims of the Course:

Obtain an overview of the different nucleosynthesis processes in the universe, an understanding of how they work, and where they work.

Contents of the Course:

Basic: Thermonuclear reactions

Big Bang nucleosynthesis

Overview of stellar evolution

Hydrostatic Nucleosynthesis I: Hydrogen burning

Hydrostatic Nucleosynthesis II: Helium burning and beyond

Hydrostatic Nucleosynthesis III: The s-process

Hydrostatic Nucleosynthesis IV: s-process components

Explosive Nucleosynthesis I: Core-collapse supernovae

Explosive Nucleosynthesis II: r-process and p-process

Explosive Nucleosynthesis III: Thermonuclear supernovae

Cosmic ray nucleosynthesis

Chemical Evolution of galaxies

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****The cosmic history of the
intergalactic medium****Course No.:** astro859

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	WT

Requirements for Participation:**Preparation:**

Basic atomic physics (hydrogen atom) and basic thermodynamics. No previous knowledge of astrophysics is required.

Form of Testing and Examination:

Written or oral examination

Length of Course:

1 semester

Aims of the Course:

The aim of this course is to familiarize students with the physics of the intergalactic medium (the material that pervades the vast regions between galaxies) and with its significance for cosmology and the astrophysics of galaxies. Thanks to progress in observations, theoretical modeling, and computational power, our knowledge in this field is growing rapidly. The main questions driving current research will be discussed and new results introduced as they occur.

Contents of the Course:

Basic: Transport of continuum and line radiation, photo-ionizations and radiative recombinations, the cooling function, the expanding universe.

Advanced: Cosmic recombination, the dark ages, hydrogen and helium reionization, 21cm-probes of the dark ages and reionization, quasar absorption systems, the UV background, the warm-hot intergalactic medium, intracluster gas, Lyman-alpha fluorescence.

Recommended Literature:

The study of the intergalactic medium is a young subject. No textbook exists for this topic. Lecture notes will be distributed.

Module:**Elective Advanced Lectures:

Introductory astronomy and cosmology lectures, stars and stellar evolution

Form of Testing and Examination:

Written or oral examination, successful exercise work

Length of Course:

1 semester

Aims of the Course:

The course will provide the necessary understanding of the basic physics of binary stars, in particular orbits, mass-transfer, chemistry and the importance of binary stars and populations of binaries to modern astrophysics.

Contents of the Course:

Most stars are not alone, they orbit a companion in a binary star system. This course will address the evolution of such binary stars and their impact on the Universe. It will start by considering orbital dynamics and observations of binaries, followed by stellar interaction in the form of mass transfer by Roche-lobe overflow and wind mass transfer. The effect of duplicity on chemistry, rotation rates and orbital parameters will be studied with the emphasis on uniquely binary-star phenomena such as type Ia supernovae, thermonuclear novae and gamma-ray bursts. It will conclude with quantitative studies of populations of binary stars.

Recommended Literature:

An Introduction to Close Binary Stars - Hilditch - Cambridge University Press ISBN 0-421-79800-0

Interacting Binary Stars - Pringle and Wade - CUP (Out of print but you can find cheap second-hand copies on www.amazon.com) ISBN 0-521-26608-4

Evolutionary Processes in Binary and Multiple Stars - Eggleton - CUP ISBN 0-521-85557-8

Module:**Elective Advanced Lectures:

Requirements for Participation:**Preparation:**

Introductory astronomy and cosmology lectures

Form of Testing and Examination:

Written or oral examination, successful exercise work

Length of Course:

1 semester

Aims of the Course:

The student will learn basic physics on supernova and gamma-ray burst, and will have an overview on their applications to various fields of astrophysics.

Contents of the Course:

Basic physics on stellar hydrodynamics, radiation processes, and stellar death.

Type Ia supernova: observations and theory. Application to cosmology

Core collapse supernova: observations and theory

Gamma-ray bursts: observations and theory.

Implications for massive star population and star-formation history

Supernova nucleosynthesis and chemical evolution of galaxies

Explosions of the first generations of stars

Some related issues: supernova remnants, neutrinos, shock break-out, etc.

Recommended Literature:

Lecture notes with key references for each topic will be provided.

Module:**Elective Advanced Lectures:

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Introduction to MoND****Course No.:** astro8505

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:****Form of Testing and Examination:**

Requirements for the examination (written): successful work with exercises

Length of Course:

1 semester

Aims of the Course:

The aim of this course is to provide an introduction to Modified Newtonian Dynamics (MoND) as a successful alternative for dark matter.

Contents of the Course:

- 1) Observational basis: baryonic Tully-Fisher relation (BTFR), radial acceleration relation (RAR), dynamical friction, planes of satellites, rotation curves of galaxies, pattern speed of spiral galaxies, tidal dwarf galaxies, stability of galactic disks, asymmetries of stellar tidal tails, galaxy and structure formation, wide-binary evolution
- 2) Theoretical framework: classical field theory, generalised Poisson equation, a quadratic MoND formulation (AQUAL), quasi-linear MoND formulation (QUMOND), pressure and rotationally supported systems, external field effect (EFE), modified gravity vs. modified inertia, discrete N-body systems in MoND, inverse Lagrangian problem, higher order Lagrangian theory, general relativistic embedding
- 3) Numerical treatment: Solving the PDEs of AQUAL and QUMOND numerically, overview and usage of existing software packages for MOND simulations, first steps in MONDian direct N-body dynamics
- 4) Open questions and current research status

Recommended Literature:

No textbook exists for this topic at the moment. Lecture notes and access to original research literature will be provided.

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Statistical Methods in Cosmology
& Astrophysics****Course No.:** astro8506

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	WT

Requirements for Participation:

None. Ideally some experience with programming, preferably in python.

Preparation:**Form of Testing and Examination:**

Written or oral examination, successful exercise work.

Length of Course:

1 semester

Aims of the Course:

Statistical methods are an integral part of cosmology and astrophysics studies. This course will give an overview of the statistical principles and tools that are used in these fields. Topics covered will include basic probability theory, estimators, hypothesis testing, Bayesian inference, sampling, and an introduction to Machine Learning. We will discuss these concepts during the lectures, while the exercise classes will focus on practical implementations of these methods to astrophysical problems using python and jupyter notebooks.

Contents of the Course:

Introduction to Python
Probabilities
Point Estimation
Maximum Likelihood
Hypothesis Testing
Regression Methods
Bayesian Inference
Error Estimation
Monte Carlo Markov Chain methods
Introduction to Machine Learning

Recommended Literature:

Notes presented in the lectures will come from a diverse set of sources and will form the main material for the course.

Additional literature:

- Statistics in Theory and Practice - Robert Lupton
- Statistics, Data Mining, and Machine Learning in Astronomy - Zeljko Ivezic, Andrew J. Connolly, Jacob T. VanderPlas, and Alexander Gray
- Modern Statistical Methods for Astronomy - Eric D. Feigelson and G. Jogesh Babu

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Advanced Topics in Cosmology****Course No.:** astro8507

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:**

General Relativity and Cosmology at the level of the Theoretical Astrophysics & Cosmology courses of the first semester.

Form of Testing and Examination:

Oral examination, successful exercise work.

Length of Course:

1 semester

Aims of the Course:

This course will build on Theoretical Astrophysics and Cosmology and introduce students to advanced concepts in cosmology with a focus on the understanding of galaxy redshift surveys. The aim of the course will be to cover the basics needed to understand the current literature and start research work in the field.

Contents of the Course:

The course consists of two parts: (1) A theoretical discussion of the evolution of matter perturbations from Inflation to the present day, (2) An introduction to observational techniques in galaxy surveys.

Recommended Literature:

Notes presented in the lectures will come from a diverse set of sources and will form the main material for the course.

Additional literature:

Modern Cosmology - Scott Dodelson (Fabian Schmidt)
Cosmological Physics - John Peacock
Cosmology - Steven Weinberg

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Dynamics of Astrophysical Fluids
and Plasmas****Course No.:** astro8508

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2+1	4	ST

Requirements for Participation:**Preparation:**

Needed: "Introduction to astrophysics", "Electrodynamics"

Useful: "Hydrodynamics", "Plasma physics", "Statistical physics", "Stellar physics"

Form of Testing and Examination:

Requirements for the examination (written or oral): successful work with the exercises

Length of Course:

1 semester

Aims of the Course:

Astrophysical objects, like stars, the interstellar medium, galaxies, and galaxy clusters, are typically modeled as fluids. Since baryonic matter (= non-Dark Matter) in the Universe is partially or sometimes even fully ionized, astrophysical fluids are coupled to cosmic magnetic fields which are detected by radio telescopes everywhere where we have the means to do so. Therefore, astrophysical flows follow the laws of magnetohydrodynamics (MHD), making this an essential tool for a modern theoretical astrophysicist. In this course, I will review the basics of MHD with selected applications to astrophysics. The students will learn which different MHD effects are important in which astrophysical problem. They will also learn how to solve the MHD equations analytically (~60% of the exercises will be pen and paper work) for special problems and the basics of how to perform numerical simulations (the remaining ~40% of the exercises). For this, the publicly available Pencil Code will be used (<http://pencil-code.nordita.org/>). The students will be running 2D sample simulations and analyze the output data with python. Python libraries for reading the simulation data will be provided.

Contents of the Course:

- 1) Introduction to astrophysical fluids; 2) From kinetic to continuum; 3) Ideal fluids; 4) Viscous fluids; 5) Compressible fluids; 6) Perturbations in hydrodynamics: waves and instabilities; 7) Turbulence; 8) Numerical methods in hydrodynamics; 9) The plasma Universe; 10) Collisionless plasma processes; 11) From kinetic theory to 1-fluid magnetohydrodynamics; 12) Basic MHD; 13) MHD turbulence and dynamos

Recommended Literature:

Choudhuri, "The physics of fluids and plasmas. An introduction for astrophysicists", Cambridge University Press, 1998

Biskamp, "Magnetohydrodynamic Turbulence", Cambridge University Press, 2003

Brandenburg & Subramanian, "Astrophysical magnetic fields and nonlinear dynamo theory", Physics Report, 2005

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Astrophysics II (MA)****Course No.:**

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	4+1	8	WT

Requirements for Participation:**Preparation:**

Astrophysics I

Form of Testing and Examination:

written test

Length of Course:

1 semester

Aims of the Course:

The student will gain the ability to apply fundamental concepts of physics to describe astrophysical phenomena and will obtain an overview of the experimental foundations of our knowledge about the cosmos. The courses will enable him to understand the fundamental principles of the universe and its history. The courses also give an introduction to topics of active research in astrophysics and thus prepares the students towards their own research activity within the master thesis.

Contents of the Course:

Based on the introductory course 'Astrophysics I' in the Bachelor program this course deepens the understanding in selected topical areas of relevance. These are:

Interstellar medium: molecular clouds, HII regions, photon dominated regions, shock waves, radiation processes, radiative transfer, astrochemistry

Star formation (low mass and high mass), planetary system formation

Galaxies: galactic structure, morphology, dynamics, chemical evolution, nuclei of active galaxies

Large scale structure of the universe: intergalactic distance ladder, galaxy clusters, dark matter, gravitational lenses, experimental cosmology

Recommended Literature:

Binney and Merrifield, Galactic Astronomy (Princeton University Press)

Binney and Tremaine, Galactic Dynamics (Princeton University Press)

Carroll and Ostlie, An Introduction to Modern Astrophysics (Addison-Wesley)

Schneider, Einführung in die extragalaktische Astronomie & Kosmologie (Springer, Berlin)

Shu, The Physics of Astrophysics I & II (University Science Books, Mill Valley)

Tielens, The Physics and Chemistry of the Interstellar Medium (Cambridge University Press)

Unsöld and Baschek, Der neue Kosmos (Springer, Berlin)

Weigert and Wendker, Astronomie und Astrophysik (VCH Verlag)

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Star Formation (MA)****Course No.:**

Category	Type	Language	Teaching hours	CP	Semester
Elective	Lecture with exercises	English	2	3	WT

Requirements for Participation:**Preparation:**

Astrophysics I (Astrophysics II recommended)

Form of Testing and Examination:

Oral examination

Length of Course:

1 semester

Aims of the Course:

Understanding of fundamental concepts of star formation in a variety of environments.

Contents of the Course:

The lecture introduces the basic aspects of Star Formation:

Physical Processes in the ISM, Interstellar Chemistry, ISM and Molecular Clouds, Equilibrium Configurations and Collapse, Protostars, Formation of High Mass Stars, Jets, Outflows, Disks, Pre-main sequence stars, Initial Mass Function, Structure of the Galaxy, Starburst Galaxies, Star Formation in the early Universe

Recommended Literature:

Palla and Stahler, Formation of Stars (Wiley)

Carroll and Ostlie, An Introduction to Modern Astrophysics (Addison-Wesley)

Shu, The Physics of Astrophysics I & II (University Science Books, Mill Valley)

Tielens, The Physics and Chemistry of the Interstellar Medium (Cambridge University Press)

Spitzer, Physical Processes in the Interstellar Medium (Wiley)

Unsöld and Baschek, Der neue Kosmos (Springer, Berlin)

Module:**Elective Advanced Lectures:
Modern Astrophysics****Module No.:** astro850**Course:****Galaxy Dynamics (MA)****Course No.:**

Requirements for Participation:**Preparation:**

Astrophysics I (Astrophysics II recommended)

Form of Testing and Examination:

Oral examination

Length of Course:

1 semester

Aims of the Course:

Understanding of fundamental concepts of stellar and galaxy dynamics.

Contents of the Course:

The lecture introduces to basic aspects of stellar and galaxy dynamics: Multiple stellar systems, dynamics of open and compact stellar clusters, elliptical, disk and barred spiral galaxies, gas kinematics, galaxy evolution in galaxy clusters, gravitational friction, violent relaxation, the Hubble fork, galaxy collisions and mergers, cosmological evolution of stellar systems.

Recommended Literature:

Binney and Merryfield, Galactic Astronomy (Princeton University Press)

Binney and Tremaine, Galactic Dynamics (Princeton University Press)

Carroll and Ostlie, An Introduction to Modern Astrophysics (Addison-Wesley)

Schneider, Einführung in die extragalaktische Astronomie & Kosmologie (Springer, Berlin)

Weigert and Wendker, Astronomie und Astrophysik (VCH Verlag)

Module No.: astro940
Credit Points (CP): 15
Category: Required
Semester: 3.

Module: Scientific Exploration of the Master Thesis Topic

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Scientific Exploration of the Master Thesis Topic	astro941	15		450 hrs	WT

Requirements for Participation:

Successful completion of 60 credit points from the first year of the Master phase, including the modules physics601, astro608, astro 810, and astro820

Form of Examination:

Presentation

Content:

Under guidance of the supervisor of the Master Thesis topic, the student shall explore the science field, read the relevant recent literature, and perhaps participate in further specialised classes and in seminars. The student shall write an essay about the acquired knowledge, which may serve as the introduction part of the Master Thesis

Aims/Skills:

The student shall demonstrate to have understood the scientific question to be studied in the Master Thesis

Course achievement/Criteria for awarding cp's:

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Useable for:

Masterstudiengang Astrophysik, Pflicht, Semester: 3

Module No.: astro950
Credit Points (CP): 15
Category: Required
Semester: 3.

Module: Methods and Project Planning

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Methods and Project Planning	astro951	15		450 hrs	WT/ST

Requirements for Participation:

Successful completion of 60 credit points from the first year of the Master phase, including the modules physics601, astro608, astro 810, and astro820

Form of Examination:

written proposal

Content:

Under guidance of the supervisor of the planned Master Thesis topic, the student shall acquire knowledge about the methods required to carry out the Master Thesis project. This may include the participation in specialised seminars or specialised classes for the Master programme. The student shall plan the steps needed to successfully complete the Master Thesis

Aims/Skills:

The student shall demonstrate to have understood the methods to be used in the Master Thesis research. The project plan has to be presented

Course achievement/Criteria for awarding cp's:

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Useable for:

Masterstudiengang Astrophysik, Pflicht, Semester: 3

Module No.: astro960
Credit Points (CP): 30
Category: Required
Semester: 4.

Module: Master Thesis

Module Elements:

Nr.	Course Title	Number	CP	Type	Workload	Sem.
1.	Master Thesis	astro960	30	Thesis	900 hrs	WT/ST

Requirements for Participation:

Successful completion of 60 credit points from the first year of the Master phase, including the modules physics601, astro608, astro 810, and astro820

Form of Examination:

Master Thesis

Content:

Under guidance of the supervisor of the Master Thesis topic, the student shall carry out the research of the Master Thesis project

Aims/Skills:

The student shall identify and work out the science question to be tackled in the Master Thesis

Course achievement/Criteria for awarding cp's:

oral presentation

Length of Module: 1 semester

Maximum Number of Participants: ca. 100

Registration Procedure:

s. <https://basis.uni-bonn.de> u. <http://bamawww.physik.uni-bonn.de>

Useable for:

Masterstudiengang Astrophysik, Pflicht, Semester: 4
